

DARLINGTON SEVEN-DIGIT CURRENT DRIVER
(functional analogue of ULN2003A, ULN2004A f. «Texas Instruments»)

Microcircuits ULN2003AN,ULN2003AD,ULN2004AN,ULN2004AD – Darlington seven-digit current driver.

Microcircuits are intended for actuating devices control.

Main characteristics:

- Output current passing through collector of one Darlington composite transistor (one digit), does not exceed 500 mA;
- voltage, provided to microcircuit output does not exceed 50 V;
- integrated circuits can directly operate semiconductor devices of different type;
- operating temperatures range from minus 40 to plus 85 °C.

Application scope: In actuating devices (relay, lamps, light emitting diodes, displays, communication lines and logic devices).

Brief summary of integrated circuits

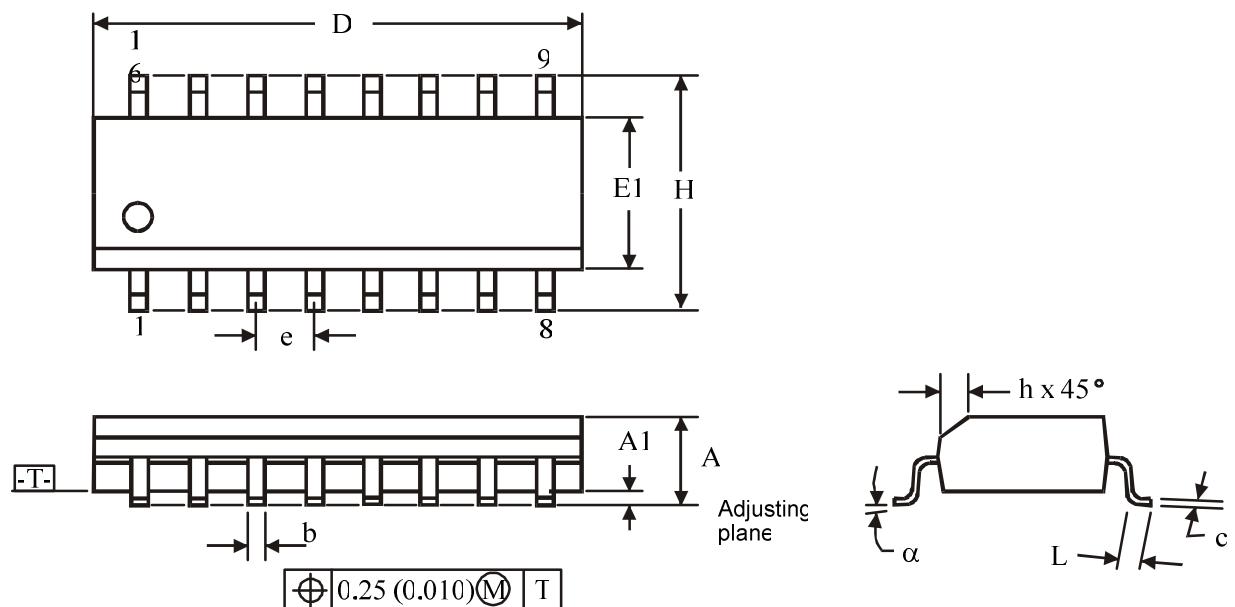

Microcircuit is a matrix of seven couples of npn transistors, switched on by Darlington circuit, with high-voltage outputs with large current load, with diodes, switched on by scheme with common cathode, for inductive load connection. Absolute maximum current passing through collector of one Darlington composite transistor (one digit), does not exceed 500 mA. For current increase, the Darlington composite transistors can be switched on in parallel. In ULN2004AN,ULN2004AD microcircuits in base chains of Darlington transistors 2,7 kOhm resistors are switched and microcircuits can directly operate TTL or 5 V CMOS devices. In microcircuits ULN2004AN,ULN2004AD in a base chains of Darlington transistors r10,5 kOhm resistors are switched and integrated circuits can directly operate CMOS devices with supply voltage of 6-15 V.
